

RESOLUTION No. 26/02

On the Temporary Regulation of the Activities of Extraterrestrial Civilizations in the Solar System and the Protection of Other Life Forms

dated "22" February 2026
Moscow

The Author,

Guided by the updated Declaration of the Rights of Humanity on the Solar System of February 22, 2026, Resolution No. 26/01 of 22.02.2026 on the Adoption of the Declaration, and other international UN instruments on activities in outer space,

Taking into account the public acknowledgment by world leaders of the high probability of the existence of extraterrestrial intelligence and the initiation of the declassification of relevant archives,

Considering the "zoo hypothesis" and the possibility that extraterrestrial civilizations may already be present in the Solar System while adhering to a policy of non-interference,

Recognizing the need to establish legal mechanisms for regulating potential contacts and protecting the interests of humanity,

Recommends that the United Nations empower the United Nations Office for Outer Space Affairs (UNOOSA), on a temporary basis until further notice, with the authority to receive applications from extraterrestrial civilizations for visiting the Solar System and to coordinate actions in the event of detecting their presence,

Declares the following:

1. All extraterrestrial civilizations (to whatever extent present) in the Solar System are hereby notified:
 - a. In connection with the initiation of a global dialogue on the declassification of information and increased public interest, humanity officially declares its readiness to establish diplomatic relations. All extraterrestrial entities conducting any activity within the Solar System are invited, within one Earth month (30 Earth days) starting from February 23, 2026, to inform humanity of their presence through the United Nations Office for Outer Space Affairs (UNOOSA) or by any other available means.
 - b. Within three Earth months (90 Earth days) starting from February 23, 2026, they shall obtain a temporary permit to visit the Solar System and

conduct research and other activities from UNOOSA, which is empowered with this right by the United Nations.

c. If staying in the Solar System for more than three Earth months (90 Earth days) starting from February 23, 2026, they shall establish a diplomatic representation, the location of which is to be coordinated with UNOOSA.

2. In the event of no response within the specified time limits, humanity reserves the right to interpret the silence as confirmation of the non-interference hypothesis and will continue the exploration of the Solar System based on the principle of natural right to its own star system, while respecting possible traces of the activities of other civilizations.
3. Any non-human civilization or other life forms that are native to the Solar System (for example, hypothetical microorganisms on Mars or in the oceans of Europa and Enceladus) have the right to the preservation of their habitat in its pristine state. All states, organizations and individuals must employ all available means and methods to preserve the habitat of extraterrestrial biological or other organisms and to prevent their destruction in the course of economic activity.
4. All UN member states, as well as private space companies, are urged to observe a moratorium on any actions that could cause irreversible damage to potential extraterrestrial ecosystems within the Solar System, pending the completion of international consultations and the elaboration of relevant protocols.

Done and signed in the city of Moscow, on the twenty-second day of February, two thousand twenty-six.
